

ABSTRACT OF THE DISCLOSURE

A nail ejector includes a main body; and a nail magazine mounted on an end of the main body. Thus, the nail ejector is pressed and operated by a user's one palm to eject the nails outward successively. In addition, the nail
5 magazine contains multiple nails which are ejected outward from the shaft hole of the guide tube successively without having to feed the nails repeatedly, thereby greatly saving the working time, and thereby enhancing the working efficiency.
